

GREEN MACHINE™
a greener planet in nothing flat

ELECTRICAL REQUIREMENTS

Arnco's Green Machine recycling system requires 3 Phase Service.

240v service setup is standard on all Green Machine systems. With this setup you will also need a **30 amp disconnect** for the Green Machine and a **60 amp disconnect** for the Grinder.

480v Service setup is available through **SPECIAL ORDER** only and at an additional cost. With the 480 setup you will need a **15 amp disconnect** for the Green Machine and a **30 amp disconnect** for the Grinder.

Because the two components operate independently you do not need to have the Grinder in a heated room, it can be placed away from the Green Machine.

HELPFUL INFORMATION

Allow a 4'x4' square area to work and maneuver an empty "A" side tote with the top cut out for storage of the grind material.

Reserve a 4' wide by 8' long area for the Green Machine. This will provide ample room to fasten supply hoses, etc. We also recommend enough room for 4 totes of material.

The Green Machine requires a gallon of G-FLUSH™ and a quart of 99% ISP alcohol to clean up after each processing. Arnco stocks G-FLUSH™, however the alcohol must be purchased locally.
